Outdoor Kitchen

Installation Guide

Installation Guide

When we first conceived our range of kitchens our design objective was to create a kitchen that can be engineered in a controlled environment, to introduce greater precision and superior quality, whilst offering an even wider choice of styles and finishes. By crafting off site we remove the need to find local tradespeople, however some installation on site may be required, so to get a better understanding please read the following guide.

Our process

Our objective is to make the journey from design to installation smooth and effortless for our customers, for this reason we have made the installation process as simple as possible.

What do we mean by installation?

No matter the client, the budget or the design we will always deliver and locate, then test the kitchen in situ, introduce you to your kitchen, and then remove all packaging and waste. Further installation may be required under certain circumstances:

1. You choose features requiring mains electricity, and/ or water and drainage
2. Your site has an existing patio of hard surface and needs
3. There are no feeds in place from existing features

To make sure that every customer has a kitchen they love with little to no effort, on their part, we can offer a comprehensive service ensuring you have nothing to arrange other than our next visit, on a day and time of your choosing.

If you are mid-way through a design or landscape project we can provide your existing contractors with the specifications to minimise further installation.

Installation Guide

Placement only

When the unit requires nothing more than a gas feed we can set this up as you would with a traditional BBQ using standalone bottle. In these circumstances' installation would require us to double check the site is stable and solid, and to level the kitchen using the adjustable feet. Once we have ensured everything is safe, secure and operational we will remove the packaging and introduce you to your new kitchen.

This type of placement only installation is included within the cost of the kitchen.

Site Survey

If you choose electrical or water dependant features and mains feeds are required then we will visit your home or property to conduct a site survey, at no cost to yourself, to ascertain the necessary steps. We will then send a formal survey detailing the next steps and any associated costs which would be fixed at that point.

Mains feeds required

With electrical features such as fridges, freezers, lighting, entertainment features, and heating the kitchen will require mains electricity. This would necessitate a site survey to ascertain the location of mains power feeds and laying of necessary cabling.

This free site survey, included within the design process, can be booked on a day and time of your choosing. This will ascertain an existing access point or required installation of an RCD protected power feed.

Installation Guide

We can either provide a qualified electrician to install an external RCD protected feed from your internal power supply, or you can use your local trusted tradesperson and we will plug in to the external socket. Depending on the relevant location an armoured cable may then be laid from the feed to the kitchen. This feed may require some grounds work to be buried under the patio etc in which case we would ensure our skilled installation team leave everything looking as it should.

Should a water feed be required then we need to look for suitable access to a water feed but also drainage into existing mains pipework. In our experience many houses have an existing external water supply which, subject to relative location can be tapped into, then requiring a feed to be laid to the kitchen itself. As with the power feed we may need to lift and relay patio stone etc to hide such pipe work.

Access to drainage needs to consider such elements as fall and relative heights to ensure fluid is successfully drained from the kitchen pipework, and as always, our aim is to install this ensuring the finished result is as practical as it is aesthetic.

In the event that you choose features requiring both electricity and water it is worth noting that the three feeds may require separate channels due to their relative access points.

The CENA

Installation Guide

Costs

If you require nothing more than a placement of your kitchen with testing, handover and removal of waste then there is no cost.

In the event that access to mains feeds is required then we will survey the site, free of charge, provide a fixed quote and then agree an installation to suit you (once the unit is ready at our factory).

STEP-BY-STEP GUIDE

- Discuss your design with our team
- Identify if a site survey is needed due to mains feed requirement
- Book date for site survey at your convenience
- Discuss survey results and costs with your designer
- Finalise design and installation
- Agree installation date
